

SOUND: Research Index

Every chapter's claim, mapped to the source that grounds or complicates it

Compiled from the "Sources Cited" list already published at aaroncheung.me/sound. Reorganized here by chapter so the research methodology, finding a source for each narrative beat rather than citing broadly, is legible on its own rather than requiring a reader to cross-reference twelve footnotes against five chapters manually.

SECTION	SOURCE	WHAT IT DOES FOR THE CLAIM
S: SECONDHAND SOUND		
01, <i>He went first</i>	McHale, Updegraff & Whiteman, <i>Journal of Marriage and Family</i> (2012)	Grounds the sibling-imitation claim: younger children model older siblings more than peers.
02, <i>I just tagged along</i>	Kraus et al., <i>Frontiers in Neuroscience</i> (2014)	Explains why passive exposure while waiting still produced measurable auditory priming.
03, <i>I wanted it so bad</i>	Habibi et al., <i>Annals of the NY Academy of Sciences</i> (2018)	Validates that starting young at the age he pushed for has a real developmental effect.
O: ON SOMEONE ELSE'S TERMS		
01, <i>The regret was fast</i>	Ericsson, Krampe & Tesch-Römer, <i>Psychological Review</i> (1993)	Establishes that deliberate practice, not talent, is what piano actually demanded.
02, <i>How I fought back</i>	Evans, McPherson & Davidson, <i>Psychology of Music</i> (2013)	Reframes the refusal to practice as a predictable response to

		externally imposed control.
03, <i>Taking pieces apart until they died</i>	Ericsson, Krampe & Tesch-Römer, <i>Psychological Review</i> (1993), reused	Complicates rather than confirms: the method was correct, but correctness cost the wonder.
04, <i>The violin, sort of</i>	Patterson, Lipp & Luck, <i>Cognition and Emotion</i> (2024)	Explains how a bad association with piano generalized to violin via evaluative conditioning.

U: UNDER NO ONE'S WATCH

01, <i>They finally let me quit</i>	Deci, <i>Journal of Personality and Social Psychology</i> (1971)	Sets the expectation the chapter then defies: removing pressure usually doesn't restore interest.
02, <i>But the piano stayed</i>	Patall, Cooper & Robinson, <i>Psychological Bulletin</i> (2008)	Identifies choice specifically, not just absence of pressure, as what changed motivation.
03, <i>I still flinched</i>	Deci, <i>Journal of Personality and Social Psychology</i> (1971), reused	Explains the delay: removing coercion clears space for wanting, it doesn't restore it automatically.
04, <i>Violin, minus the shadow</i>	Patterson, Lipp & Luck, <i>Cognition and Emotion</i> (2024), reused	Notes the asymmetry: a bad association spreads easily, but doesn't lift on its own the same way.

N: NOTHING BUT EAR

01, *I put down the sheet music*

	Green, <i>How Popular Musicians Learn</i> , Ashgate (2002)	Places the YouTube, by-ear approach inside an established informal-learning tradition.
02, <i>Turns out I had an ear</i>	Woody, <i>Music Educators Journal</i> (2012)	Explains why violin specifically, an instrument with no fixed keys, trained relative pitch.
03, <i>Now I'm doing it on piano</i>	Woody & Lehmann, <i>Journal of Research in Music Education</i> (2010)	Shows self-taught, by-ear musicians measurably outperform formally trained peers on this skill.
D: DA CAPO		
01, <i>What I'd tell the kid on the bench</i>	Gruber, Gelman & Ranganath, <i>Neuron</i> (2014)	Grounds "wonder" as neurologically real, not sentiment: curiosity measurably improves learning.
02, <i>So I'm starting over on purpose</i>	Woody & Lehmann, <i>Journal of Research in Music Education</i> (2010), reused	Confirms the ear transfers across instruments, closing the loop on what carries into guitar next.

Three sources are cited twice, each reuse pairing the same finding with a different narrative moment rather than repeating an argument already made. Full citations with DOIs are available in the case study and on the live site.
